

Vascular Services

Interventional Radiologists are highly trained physicians who use imaging techniques to perform minimally invasive procedures. They are trained to view images to diagnose disease and recommend treatment, as well as, complete any minimally invasive procedure of the vascular system. Minimally invasive procedures were in fact created by interventional radiologist.

From the MRA (Magnetic Resonance Angiography) or CTA (Computed Tomographic Angiography) to the Balloon Stenting or Angioplasty, Interventional Radiologist can take care of these needs. While Vascular Surgeons have begun to do these minimally invasive procedures recently, Interventional Radiologists have been doing these procedures for many years.
